

# For Visualizations

1. **[Line Graph]** Analyze whether the number of enrollees from kindergarten to senior high school is proportional across grade levels.
  - This visualization will help lawmakers identify trends and gaps in enrollment, enabling them to propose policies that encourage students to complete their education (e.g., improving accessibility and affordability).
2. **[Bar Chart]** Compare enrollment numbers across regions, provinces, and municipalities.
  - This chart will allow lawmakers to determine whether enrollment variations are driven by population size or other factors (e.g., infrastructure, economic conditions), informing targeted interventions.
3. **[Table]** List the top 10 schools with the highest and lowest enrollment numbers, including their classification (public or private).
  - This table will enable lawmakers to analyze why certain schools in specific regions, provinces, or municipalities have high or low enrollment. They can assess whether a school's public or private status influences enrollment and make informed decisions on budget allocation and resource distribution.
